Fireside tales

Two figures look at the summit of Volcán de Fuego (Guatemala) from their basecamp. In June 2018, Fuego generated catastrophic pyroclastic density currents that devastated the nearby community of San Miguel Los Lotes, resulting in hundreds of fatalities and considerable socio-economic upheaval. In this issue, Ailsa Naismith and colleagues investigate how the past experiences of those living in the shadow of the volcano influences their propensity to evacuate the area in the event of hazardous volcanic activity. Interviews with local inhabitants reveal marked differences between the perceptions of risk: fundamentally, eruptive activity is experienced differently by different people.
